

Real-Time Group Performance Measurement Using AI

The project was carried out at Master Good.

The Challenge

A termelési műszakokon belüli teljesítménykülönbségekre csak utólag derült fény, ezért a vezetők nem tudtak időben beavatkozni a folyamatokba.

AI solution

Differences in performance within production shifts only came to light after the fact, rendering managers unable to intervene in the processes in a timely manner.

Results

Real-time performance feedback.

Enabling immediate managerial intervention.

More efficient shift scheduling.

Significant increase in productivity.

Return on Investment

The investment paid for itself in less than a financial quarter.
